

PROPOSAL FOR THE Mini Hospital Management System

(Using C#.Net and SQL Server)

Session: 2025 – 2029

Submitted By:

Zainab Qudsia

Reg#: 2025-CS-1214

Supervised By:

Mr. Talha Mubashir

Department of Computer Science
University of Engineering and Technology
Lahore Pakistan

1. Introduction

The Mini Hospital Management System is a desktop-based application developed using C#.NET and SQL Server to manage basic hospital operations efficiently. The system is designed to simplify the process of storing and retrieving patient, doctor, diagnosis, and medicine records.

In many small clinics and hospitals, record management is often done manually, which leads to inefficiency, data redundancy, and errors. This project aims to computerize these operations and provide a simple, user-friendly interface for managing hospital data.

2. Objectives

The main objectives of this project are:

- To develop a user-friendly system for managing hospital records
- To store and manage patient and doctor information efficiently
- To record diagnosis details along with prescribed medicines
- To reduce manual paperwork and improve data accuracy
- To provide quick access to hospital data through search functionality

3. Scope of the System

This is a mini-level project focused on core hospital functionalities. The system will include the following modules:

1. Loading Page

- a. Displays a splash screen when the application starts

2. Authentication Module (Admin Login)

- a. Secure login for admin access
- b. Only authorized users can manage system data

3. Doctor Management Module

- a. Add, update, delete doctor records
- b. View list of doctors

4. Patient Management Module

- a. Add, update, delete patient details
- b. Store information such as name, age, gender, and contact

5. Diagnosis Module

- a. Record diagnosis details for patients
- b. Link doctor and patient
- c. Store symptoms, diagnosis description, and date

6. Medicine Management Module

- a. Add, update, delete medicine records

- b. Assign medicines to patients during diagnosis

7. Search Functionality

- a. Search patients and doctors by ID or name

4. Tools and Technologies

The following tools and technologies will be used:

1. Programming Language: C#
2. Framework: .NET Framework / .NET (Windows Forms or WPF)
3. Database: SQL Server
4. IDE: Visual Studio
5. Platform: Windows Desktop Application

5. System Features

1. Simple and user-friendly interface
2. Secure login system
3. Efficient data storage using a database
4. Easy retrieval of patient and doctor records
5. Organized management of diagnosis and medicines

6. ER Diagram (Conceptual Idea)

The system will include the following main entities:

Entities and Relationships:

Admin

- AdminID (Primary Key)
- Username
- Password

Doctor

- DoctorID (Primary Key)
- Name
- Specialization
- Contact

Patient

- PatientID (Primary Key)
- Name
- Age
- Gender
- Contact

Diagnosis

- DiagnosisID (Primary Key)
- PatientID (Foreign Key)
- DoctorID (Foreign Key)
- Symptoms
- DiagnosisDetails
- Date

Medicine

- MedicineID (Primary Key)
- Name
- Price

Diagnosis_Medicine (Relationship Table)

- ID (Primary Key)
- DiagnosisID (Foreign Key)
- MedicineID (Foreign Key)
- Quantity

Relationships:

- One Doctor can diagnose many Patients
- One Patient can have multiple Diagnoses
- One Diagnosis can include multiple Medicines
